

# Thawing Using Approved Methods

## Under Refrigeration

- \* Plan ahead—large items may take several days to thaw
- \* Maintain refrigeration at 41°F or less
- \* Also known as “slacking”

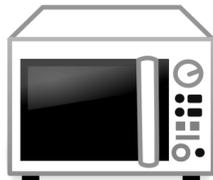

## As Part of Cooking

- \* Taken directly from frozen to cooking
- \* Great for foods that are small (e.g. frozen shrimp)

## In Microwave (To Be Immediately Cooked)

- \* To be transferred immediately to a conventional cooking process
- \* Entire cooking process can occur in microwave

## Fully Submerged Under Cold Running Water

- \* Ensure running water flows fast enough to remove and float off loose particles
- \* Ensure all portions of food are fully submerged under water
- \* Running water should be cold; food should not rise above 41°F for more than 4 hours

- Freezing merely slows down bacterial growth
- When thawing frozen foods, outer portions will rise in temperature faster than the middle portion
- Keep foods safe! As thawing normally takes more than four hours, it is very important to thaw foods properly to limit bacterial growth
